

Verus Server Evidence Management System

Data911's Verus Server is the most comprehensive back-end software on the market today. Verus Server is a browser-based system loaded on a Windows server and provides full search capability of information stored on the server — from real-time incident capture to the interview room. Verus Server is user friendly and efficient as the captured video/audio information on the server can be reviewed in a variety of locations.

Key Features

No special client software is needed
all user interaction is done through a standard web browser

All media is accessed using web addresses
for easy linking from external applications, such as an agency's records management system

Comprehensive searches
can be custom tailored, saved, and shared

Media Collections
allows for creating cases from related media that can be exported as a group

Media Synchronization
provides the ability to play back events recorded by multiple units at the same time and place concurrently

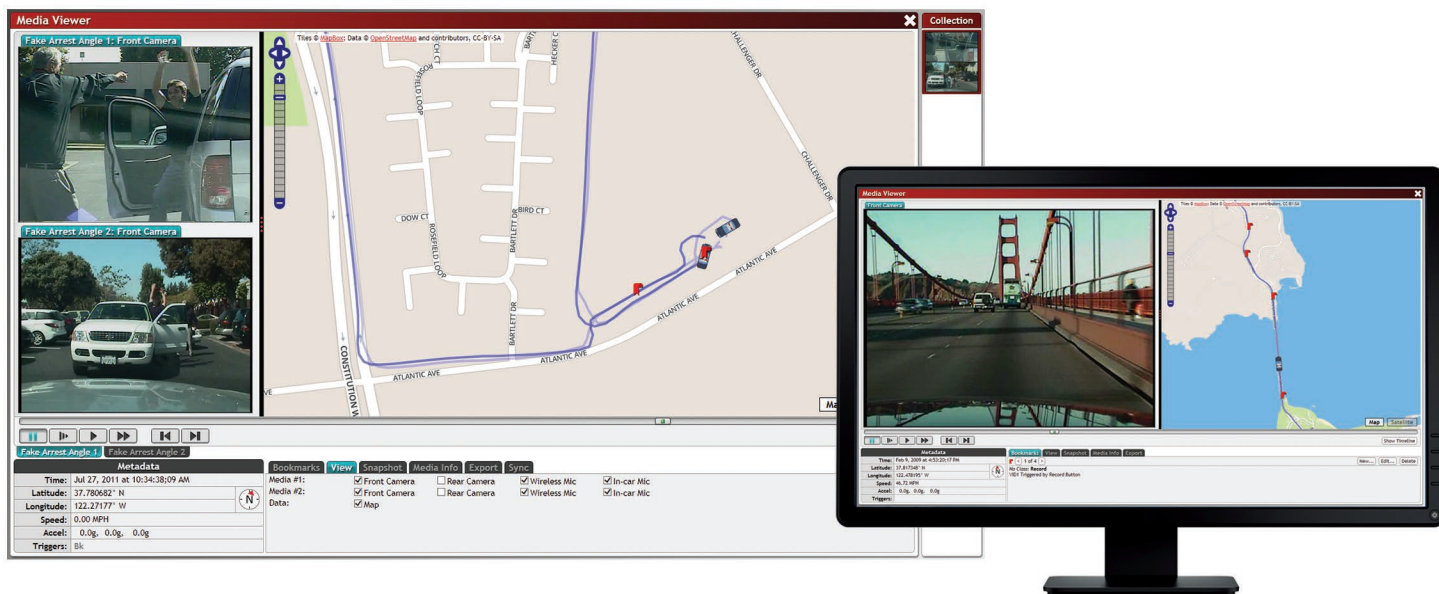

Wide evidence handling
by bringing in audio and video files from voice recorders, cellphones, and other devices

Wireless upload
vehicles automatically upload media when in range of the station

Remote management of client software
automated rollout of software updates

Verus Server Provides Unparalleled Video Evidence Management

Video Playback and Management

- High-quality video playback with synchronized maps, tags and other metadata; flexible options for selectable playback views
- Many types of media can be imported such as recorded events, interview room events and license plate reads
- Export media to standard DVD-Video discs for viewing on any DVD player
- For large departments with multiple precincts, satellite upload servers can work to gather and manage videos from many access points over a large area

Mobile Configuration

- System Administrators can define and configure mobile video setups from one central point, then automatically download changes to all mobile units when in range
- Configurable mobile recorder, video, audio, triggers, outputs, LPR and on-screen displays

Interview Room Video Management

- View, store and organize the video/audio files generated in the in-station interview rooms
- All authorized users can view and listen to interviews in real time through any network enabled work station
- Interview files are stored and managed in the same system as the in-vehicle files, thereby saving the agency from having to purchase separate video evidence storage and management equipment

System Users/Rights and Administration

- System Administrators can define users, group, roles and lockdown User Rights
- System security changes are automatically updated in the mobile vehicles
- System Administration at the server is comprehensive and easy to use
